GENERAL INFORMATION
The PS24 power supply module is an accessory for Honeywell control panels intended for use in commercial fire installations. The PS24 has two triggerable 24VFW (full wave rectified, unfiltered), 1.7A Class B, Style Y outputs that can either provide 24VFW auxiliary power, or can convert up to two control panel 12VDC EOLR supervised bell circuit outputs to 24VFW EOLR supervised bell outputs.

Each of the PS24 outputs, labeled OUTPUT A and OUTPUT B, has a corresponding controlling input, labeled INPUT A and INPUT B, respectively. Negative voltages applied to INPUT A and INPUT B are passed through to the associated output, allowing the control panel to supervise bell circuit wiring connected to that output (as required for installations which use the output for 24VFW, EOLR-supervised bell circuit operation). Applying positive voltages of 9.5–14VDC to INPUT A and INPUT B produces 24VFW at the respective output terminals.

For installations which require 24VFW auxiliary power, you must wire INPUT A and/or INPUT B to the control panel's 12VDC auxiliary power terminals so that the associated PS24 output remains activated continuously. For installations which require 24VFW EOLR supervised bells, you must wire INPUT A and/or INPUT B to the control panel's 12VDC EOLR supervised bell terminals.

Primary power for the PS24 power supply module is supplied by a 1451-24 transformer, which consists of an AC power transformer and a manually resettable circuit breaker mounted inside a protective enclosure. The 1451-24 transformer has two secondary windings - a 30VAC/188VA winding which is used to power the PS24 module, and an 18VAC/72VA winding which is used to power the control panel. The PS24 module monitors its connection to the 1451-24 and can report a low AC condition to the control panel via one of the control panel's EOLR supervised zones.

NOTES:
1. The 1451-24 transformer is not supplied with the PS24 unless part of a kit (see Note 2).
2. Complete control panel kits are available, consisting of the control panel, PS24 module, and 1451-24 Transformer. For example, a VISTA-250FBP control panel kit is available under part No. V250FBP-24, and consists of the VISTA-250FBP control panel, PS24 module, 1451-24 transformer, and a few other peripheral devices.

Secondary power for the PS24 power supply module is supplied by a pair of 12VDC lead-acid (gel cell) batteries rated at 7AH minimum, 17.2AH maximum. Both batteries connect directly to the PS24 module which internally configures them to provide 24V back-up power for its outputs, and 12V back-up power for the control panel. The PS24 module charges and tests these batteries and can report a low or disconnected battery condition to the control panel via one of the control panel's EOLR supervised zones.

MOUNTING
The PS24 module is designed to mount inside the control panel enclosure.

For dry, indoor use only. Do not install in air-handling spaces.

Referring to Figure 1, attach the PS24 PCB to the metal bracket (supplied) using the four #6 sheet metal screws (supplied). Then, clip the PS24 bracket onto the left sidewall of the control panel enclosure as shown in Figure 2. This method of mounting leaves room in the control panel's enclosure for the panel/module back-up batteries. Affix the Summary of Connections label (supplied) to the door of the control.

UL
For all fire (NFPA) and UL Commercial Burglary installations, the PS24 must be tamper protected or mounted in a tamper-protected cabinet.

NOTE: The control panel enclosure should be mounted to the wall before attempting to install the PS24 module because the PS24 will block access to the control's left mounting hole.

BATTERY CAPACITY CALCULATIONS
The PS24 module requires connection of two 12VDC lead acid (gel cell) batteries rated at 7AH minimum/17.2AH maximum. The PS24 configures these batteries to provide 24V back-up power for its 24V outputs and 12V back-up power for the control panel. See the CONNECTIONS AND POWER UP PROCEDURES section for battery connection details.
UL requires that the battery’s capacity be sized for 24 hours of standby time, followed by 5 minutes of alarm time for commercial fire installations or 15 minutes of alarm time for commercial fire/burglary installations.

Appropriate battery capacity can be calculated using the worksheets below.

1. Fill in the total control panel standby and alarm currents in the worksheet below. These totals must include the control panel’s PCB currents as well as the currents drawn from the control panel’s auxiliary power and bell power outputs. Refer to the control panel’s installation instructions to determine these currents.

2. Fill in the Total PS24 MODULE Load Worksheet, below, to determine the PS24’s total standby and alarm current loading. Then use the BATTERY CAPACITY CALCULATION WORKSHEET to determine the capacity required for each of the PS24’s batteries. Select 12-volt batteries from the BATTERY SELECTION TABLE having capacities, which are greater than, or equal to, the calculated capacities.

### NOTES:

1. Input A and Input B draw 50mA from the control panel when 9.5V–14V is applied to actuate the corresponding output. Be sure to include this in the control panel’s total load.

2. When configured for auxiliary power operation, enter the continuous load in the standby column and enter the continuous load plus any additional intermittent alarm load in the alarm column. When configured for bell circuit operation, enter “0” in the standby column and enter total load in the alarm column.

3. The largest battery capacity supported by the PS24 is 17.2AH. Total PS24 standby current must be limited to 610mA maximum for this battery.

### CONNECTIONS AND POWER UP PROCEDURES

A 7-wire harness, consisting of six #16 AWG and one #14 AWG wires, is provided for making connections between the PS24 and the control panel. Use the #16 AWG wires to make connections to the PS24’s INPUT A, INPUT B, LOW AC, and LOW BATTERY terminals. Use the #14 AWG wire to make connections to the PS24’s Earth Ground terminal. Wire AC power and earth ground as shown in Figure 3. DO NOT APPLY AC POWER AT THIS TIME.

- Wire INPUT A, INPUT B, OUTPUT A and OUTPUT B for the desired auxiliary power or bell circuit operation as shown in Figure 3. Devices powered from OUTPUT A or from OUTPUT B must be rated for 21–30VFW (full wave rectified, unfiltered) operation.

The following UL Listed devices are compatible with outputs configured for auxiliary power operation.

- Use UL listed, polarized fire indication devices on outputs configured for EOLR supervised bell circuit operation. Refer to the tables below for examples of compatible fire indication devices and for recommended limits on bell circuit wire run length.

- Wire the LOW AC and LOW BATTERY outputs to separate control panel EOLR supervised zones. Program the respective control panel’s zones for 24-hour trouble response.

- Connect the PS24’s CONTROL BATTERY POWER output fast-on terminals to the control panel’s battery terminals, using the battery cables supplied with the control panel.

- Apply AC power and verify that the proper battery float charging voltage (27.0–27.6VDC) is present across the BATT 1 (+) and BATT 2 (-) terminals. Then connect two 12V lead-acid batteries as shown in Figure 3, using the battery cables supplied.
NOTE: The battery cable’s female Fast-on terminals should be clipped off when making connections to the 17.2 AH batteries.

- Verify that the LOW AC and LOW BATTERY outputs are in the not-faulted state (i.e.: shorted to ground through 220 ohms). Verify that OUTPUT A and OUTPUT B are in the proper state (i.e.: 24V for auxiliary power operation; not active for bell circuit operation).

**Notes:**
1. Used in conjunction with the Wheelock DSM-12/24 Sync Module.
2. Strobe set to 15 Candela.
3. Strobe set to 110 Candela.
4. Used in conjunction with the System Sensor MDL Sync Module.
5. Strobe set to 135 Candela.
6. Used in conjunction with the Gentex AVSM or AVS44 Sync Module.
7. Strobe set to 150 Candela
8. Refer to the manufacturer’s documentation for the each device’s current rating.
9. When the Wheelock documentation states different current ratings for 24VDC and 24VRMS, the greater of the two must be used for load calculations. The minimum operating voltage is 16VDC.

**SPECIFICATIONS**

**Physical:**
- 4-1/4” W x 9-1/4” H x 2-1/2” D (PCB/bracket size).

**Electrical:**
- **Primary power:** From 1451-24 transformer. Use the 30VAC/188VA secondary winding on this transformer. Transformer input rating 120VAC, 60 Hz, 2.7A
- **Backup Power:** Use two 12VDC, 7AH min/17.2AH max lead-acid (gel cell) batteries.
- Float charging voltage: 27.0–27.6VDC. Standby time: Up to 24 hours depending on PS24 and control panel loading. See text.
- Recharge time: Up to 48 hours.
- **Fusing:** PTC circuit protector.
- **Input A/B:** Compatible with control panel auxiliary power and EOLR supervised bell circuit outputs rated 9.5–14VDC.
- **Current draw:** 50mA when 9.5–14VDC applied to activated associated output; 0mA otherwise. Output A/B 21–30VFW (24V nominal) full wave rectified, Unfiltered, 1.7A max. For bell circuit operation: Use UL listed, polarized fire indicating devices rated 21–30VFW. The control panel supervises the 24VFW bell wiring; use the EOLR supplied with the control panel.
- **Fusing:** PTC circuit protector.
- **Outputs power limited.**
- **Control Battery:** For connection to the control panel’s 12V Power Output battery terminals only. Can supply up to 2.8A during an AC power outage.
- **Fusing:** Internal solid state current limit.
- **Charger Fail, Low AC Output, Low Battery:** Normally shorted to ground through 200 ohms, short circuit when AC power is low (less than approx. 23.0V).
- PS24 runs a brief battery test every minute to determine if battery leads are connected and runs an extended battery test every 4 hours to determine if battery capacity is low.

**Agency Listings:**
- UL864, FM, CFM, MEA Listed.
FOR DETAILS ON THE LIMITATIONS OF THE ENTIRE ALARM SYSTEM, REFER TO THE INSTALLATION INSTRUCTIONS FOR THE CONTROL PANEL WITH WHICH THIS DEVICE IS USED.
